

A rapid and accurate snapshot of workers' wellbeing.

KEEP YOUR WORKERS *safe*

ACCREDITED URINE HEALTH MONITORING SERVICE

Keep your employees safe from hazardous chemicals and your business compliant with all occupational health and safety regulations with our urine health monitoring service, designed to detect exposure to isocyanates and phenols.

What are they?

Isocyanates: These chemicals are widely present in the production of polyurethane-based foams, coatings, and adhesives, in the automotive sector, the production of, and in the mining sector. Breathing them in can lead to skin sensitisation, respiratory issues, and occupational asthma.

Phenols: Used in various applications, including paints, disinfection, textiles, and pharmaceuticals. Phenols can pose long-term health risks like vertigo, skin problems, and liver damage.

Why monitor?

In Australia, health surveillance for isocyanates is legislated. If you use isocyanate-based products, you will need a health surveillance scheme. A health surveillance scheme for isocyanates typically involves monitoring workers' health at regular intervals.
